App. Ser. No.: 10/779,401

IN THE CLAIMS:

Please find below a listing of all pending claims. The statuses of the claims are set forth in parentheses. For those currently amended claims, <u>underlined</u> emphasis indicates insertions and strikethrough emphasis (and/or double brackets) indicates deletions.

1. (Original) A storage control apparatus that receives a packet including data required to execute a predetermined command and that executes the command based on the data in the packet received, comprising:

an attribute registering unit to register information about an attribute of packets that are receivable corresponding to a command;

an attribute acquiring unit that acquires information about an attribute of the packet received; and

a reception error handling unit that, upon occurrence of a reception error that there is no information in the attribute registering unit corresponding to the information acquired by the attribute acquiring unit, executes a predetermined reception error handling routine according to a type of the reception error.

 (Original) The storage control apparatus according to claim 1, wherein the information about the attribute of the packet includes information about a type of the packet, and

the reception error handling unit abandons the packet received upon occurrence of a reception error that there is no information about the type of the packet in the attribute registering unit corresponding to the information about the type of the packet acquired by the attribute acquiring unit.

3. (Original) The storage control apparatus according to claim 1, wherein the information about the attribute of the packet includes information about a length of the packet, and

App. Ser. No.: 10/779,401

the reception error handling unit abandons the packet received upon occurrence of a reception error that there is no information about the length of the packet in the attribute registering unit corresponding to the information about the length of the packet acquired by the attribute acquiring unit.

4. (Currently amended) The storage control apparatus according to claim 1, wherein

the information about the attribute of the packet includes information about—a sequence an order of receiving the packet, and

the reception error handling unit abandons the packet received upon occurrence of a reception error that there is no information about the sequence order of receiving of the packet in the attribute registering unit corresponding to the information about the sequence order of receiving of the packet acquired by the attribute acquiring unit.

- 5. (Original) The storage control apparatus according to claim 1, wherein the reception error handling unit executes a part of the reception error handling routine as a firmware process executed by a microcomputer.
- 6. (Original) A storage apparatus that receives a packet including data required to execute a predetermined command and that executes the command based on the data in the packet received, comprising:

an attribute registering unit to register information about an attribute of packets that are receivable corresponding to a command;

an attribute acquiring unit that acquires information about an attribute of the packet received; and

a reception error handling unit that, upon occurrence of a reception error that there is no information in the attribute registering unit corresponding to the information acquired by the attribute acquiring unit, executes a predetermined

App. Ser. No.: 10/779,401

reception error handling routine according to a type of the reception error.

7. (Currently amended) The storage control apparatus according to claim 6, wherein

the information about the attribute of the packet includes information about a type of the packet, and

the reception error handling unit abandons the packet received upon occurrence of a reception error that there is no information about the type of the packet in the attribute registering unit corresponding to the information about the type of the packet acquired by the attribute acquiring unit.

8. (Currently amended) The storage control apparatus according to claim 6, wherein

the information about the attribute of the packet includes information about a length of the packet, and

the reception error handling unit abandons the packet received upon occurrence of a reception error that there is no information about the length of the packet in the attribute registering unit corresponding to the information about the length of the packet acquired by the attribute acquiring unit.

 (Currently amended) The storage control apparatus according to claim 6, wherein

the information about the attribute of the packet includes information about—a sequence an order of receiving the packet, and

the reception error handling unit abandons the packet received upon occurrence of a reception error that there is no information about the sequence order of receiving of the packet in the attribute registering unit corresponding to the information about the sequence order of receiving of the packet acquired by the attribute acquiring unit.

PATENTDocket No.: 03-51985

App. Ser. No.: 10/779,401

10. (Currently amended) The storage control apparatus according to claim 6, wherein the reception error handling unit executes a part of the reception error handling routine as a firmware process executed by a microcomputer.

11. (Original) A method of receiving a packet including data required to execute a predetermined command and executing the command based on the data in the packet received, comprising:

registering information about an attribute of packets that are receivable corresponding to a command;

acquiring information about an attribute of the packet received; and executing, upon occurrence of a reception error that there is no information in the attribute registering unit corresponding to the information acquired by the attribute acquiring unit, a predetermined reception error handling routine according to a type of the reception error.

12. (Original) The method according to claim 11, wherein the information about the attribute of the packet includes information about a type of the packet, and

the executing includes abandoning the packet received upon occurrence of a reception error that there is no information about the type of the packet in the attribute registering unit corresponding to the information about the type of the packet acquired by the attribute acquiring unit.

13. (Original) The method according to claim 11, wherein the information about the attribute of the packet includes information about a length of the packet, and

the executing includes abandoning the packet received upon occurrence of a reception error that there is no information about the length of the packet in the

App. Ser. No.: 10/779,401

attribute registering unit corresponding to the information about the length of the packet acquired by the attribute acquiring unit.

14. (Currently amended) The method according to claim 11, wherein the information about the attribute of the packet includes information about—a sequence an order of receiving the packet, and

the executing includes abandoning the packet received upon occurrence of a reception error that there is no information about the <u>sequence order</u> of receiving of the packet in the attribute registering unit corresponding to the information about the <u>sequence order</u> of receiving of the packet acquired by the attribute acquiring unit.

- 15. (Original) The method according to claim 11, wherein the executing includes executing a part of the reception error handling routine as a firmware process executed by a microcomputer.
- 16. (Currently amended) A computer-readable recording medium that stores a computer program that realizes on a computer receiving a packet including data required to execute a predetermined command and executing the command based on the data in the packet received, the computer program making the computer at least execute:

registering information about an attribute of packets that are receivable corresponding to a command;

acquiring information about an attribute of the packet received; and executing, upon occurrence of a reception error that there is no information in the attribute registering unit corresponding to the information acquired by the attribute acquiring unit, a predetermined reception error handling routine according to a type of the reception error.

PATENTDocket No.: 03-51985

App. Ser. No.: 10/779,401

17. (Currently amended) The <u>computer-readable recording medium-computer</u> program according to claim 16, wherein

the information about the attribute of the packet includes information about a type of the packet, and

the executing includes abandoning the packet received upon occurrence of a reception error that there is no information about the type of the packet in the attribute registering unit corresponding to the information about the type of the packet acquired by the attribute acquiring unit.

18. (Currently amended) The <u>computer-readable recording medium-computer</u> program according to claim 16, wherein

the information about the attribute of the packet includes information about a length of the packet, and

the executing includes abandoning the packet received upon occurrence of a reception error that there is no information about the length of the packet in the attribute registering unit corresponding to the information about the length of the packet acquired by the attribute acquiring unit.

19. (Currently amended) The <u>computer-readable recording medium computer</u> program according to claim 16, wherein

the information about the attribute of the packet includes information about—a sequence an order of receiving the packet, and

the executing includes abandoning the packet received upon occurrence of a reception error that there is no information about the <u>sequence order</u> of receiving of the packet in the attribute registering unit corresponding to the information about the <u>sequence order</u> of receiving of the packet acquired by the attribute acquiring unit.

20. (Currently amended) The computer-readable recording medium-computer

App. Ser. No.: 10/779,401

program according to claim 16, wherein the executing includes executing a part of the reception error handling routine as a firmware process executed by a microcomputer.
